Group 2 Team Statement

Our goal is to build a database system for the Control Group Consortium. The system helps us manage research resources including scheduling events, tracking equipment usage, managing staff assignments, and documenting costs. We will discuss the database details together, especially the business logic and database design. We'll also check the consistency between the ERD, database schema, SQL queries, web pages, and final report.

The work will be divided based on the main parts of the database:

- **Iris Guo:** In charge of institutions, researchers, collaborations, projects, experiments, and experiment phases. This includes designing the tables, adding sample data, and writing at least two queries related to research activity and collaboration between institutions. Iris will also help combine everyone's ERD diagrams into one complete model.
- **Haoquan Zhang (Ryan):** In charge of facilities, equipment, equipment location history, reservations, maintenance, and calibration. Ryan will set up the related tables and sample data, write at least two queries about equipment usage and maintenance, and check any possible scheduling conflicts.
- **Qisheng Zhou (Jason):** In charge of technical staff, qualifications, assignments, training certifications, and access records. Jason will design the tables, prepare sample data, and write at least two queries about staff workload and qualifications. Jason will also work on the resource and staffing web page, using the query results developed together with Ryan.
- **YanHan Zhu (Mark):** In charge of funding sources, funding restrictions, usage charges, cost allocations, paying parties, and billing adjustments. Mark will create the tables and sample data, write at least two queries about funding and costs, and develop the research activity and billing web page with support from Iris.

Since our tables are connected with each other, each group member will need to check their own tables and queries and help with the analysis report. We will discuss together when we find problems about the business logic or database design. Everyone will help combine different parts of the database, export the final files, test the complete database system, and prepare for the final presentation. We will meet at least once a week to discuss the progress of the project and solve any problems we encounter. We plan to review each other's work in pairs. Iris and Mark, as well as Ryan and Jason will review each other's work. We will try to point out potential problems during the review and help each other if someone gets stuck.

We will adjust the work breakdown if some tasks, such as connecting tables and building webpages, take longer than expected. If someone takes more time on the work than others, we will revise to divide the remaining tasks more reasonably. We'll try to distribute the workload fairly, considering the time it takes and the difficulty of each task.
