Group 2 Team Statement

Our team agrees that the main goal of this project is to build a database system for The Control Group Consortium. The system will help manage research resources, including scheduling, equipment usage, staff assignments, and costs. We will discuss the project requirements and make important decisions together, especially when it comes to business rules and database design. We also want to make sure that our ERD, 3NF tables, SQL queries, web pages, and final report are consistent with each other.

We have discussed how to divide the work based on the different parts of the system:

- **Iris:** Responsible for institutions, researchers, collaborations, projects, experiments, and experiment phases. This includes designing the tables, adding sample data, and writing at least two queries related to research activity and collaboration between institutions. gyyyy will also help combine everyone's ERD diagrams into one complete model.
- **Ryan:** Responsible for facilities, equipment, equipment location history, reservations, maintenance, and calibration. ZHQ will create the related tables and sample data, write at least two queries about equipment usage and maintenance, and check for possible scheduling conflicts.
- **Jason:** Responsible for technical staff, qualifications, assignments, training certifications, and access records. ZQS will design the tables, prepare sample data, and write at least two queries about staff workload and qualifications. ZQS will also work on the resource and staffing web page, using query results developed together with ZHQ.
- **Mark:** Responsible for funding sources, funding restrictions, usage charges, cost allocations, paying parties, and billing adjustments. ZYH will create the tables and sample data, write at least two queries about funding and costs, and develop the research activity and billing web page with support from gyyyy.

Although we each have our own responsibilities, we understand that the different parts of the database are connected. Each person will test their own tables and queries and contribute to the written report. We will also help each other when relationships between different modules need to be checked. Tasks such as combining the database, exporting the final files, checking the completed system, and preparing the presentation will be shared by everyone.

To stay organized, we plan to use GitHub and a shared task list to keep track of our progress. We will check in with each other at least once a week and discuss any problems we run into. We also plan to review each other's work, with gyyyy and ZYH reviewing each

other's sections, and ZHQ and ZQS doing the same. If someone gets stuck, we will try to help rather than leave that person to solve everything alone.

We know that some parts of the project may take more time than expected, especially when we start connecting all the tables and building the web pages. For example, ZQS can help ZHQ test scheduling conflicts involving staff and equipment. If someone ends up with significantly more work, we will discuss how to redistribute some tasks. Our goal is not necessarily for everyone to write exactly the same amount of code, but for everyone to make a fair contribution based on the time and difficulty of their tasks.

Overall, we want everyone to be involved in both their own section and the final project. We will communicate regularly, help each other when needed, and make sure that the final system reflects the work of the whole team.
